POINTS EARNED							

University of Bahrain

College of Information Technology

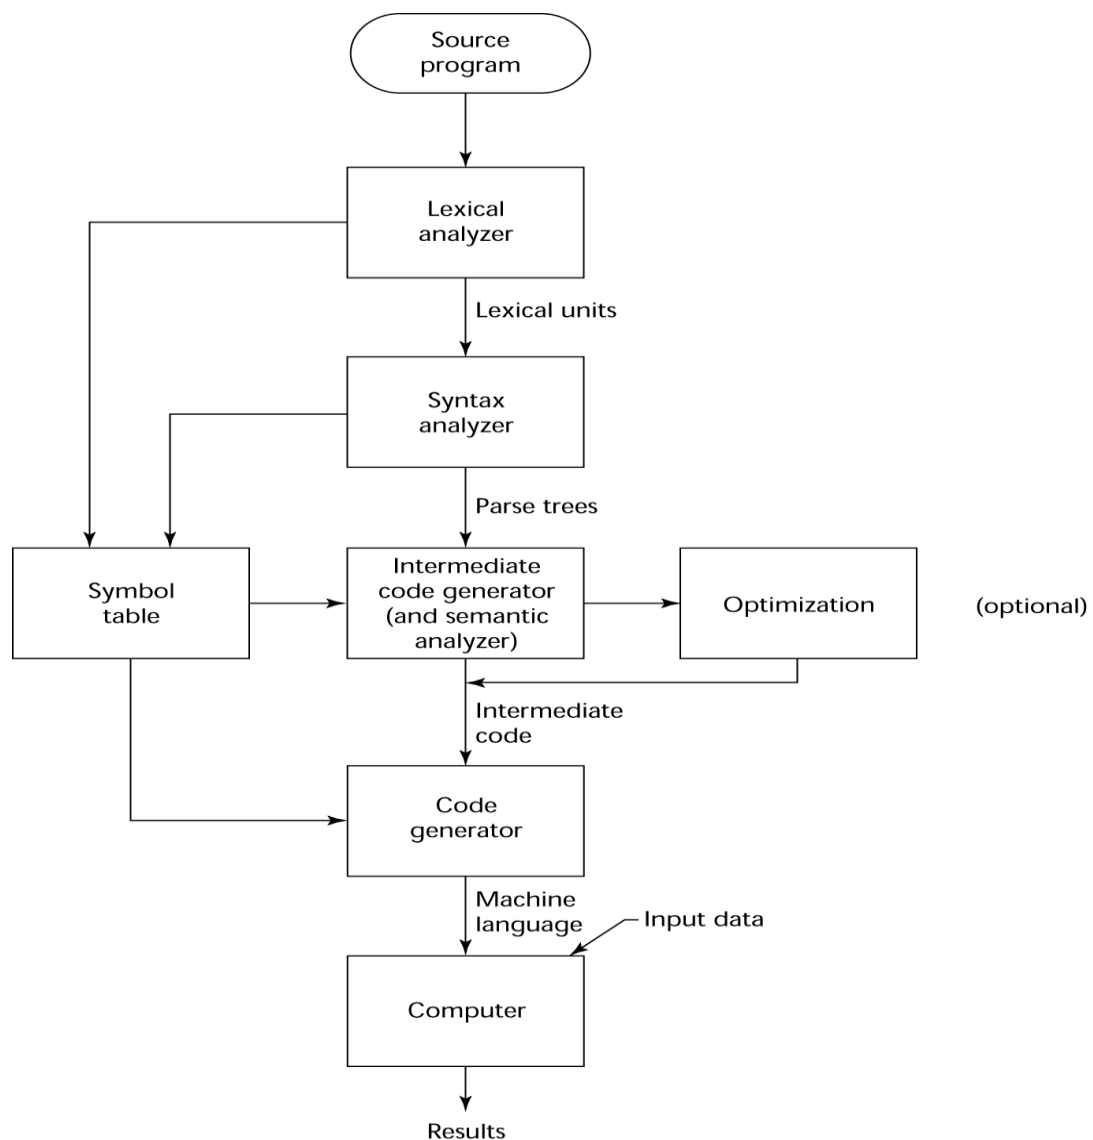

Department of Computer Science

ITCS 332: Organization of Programming Languages FIRST TEST Date: OCT 29, 2015

QUESTION ONE:

[13 pts]

Draw the flowchart that illustrates the steps of a compilation process of any HLL programming language .

QUESTION TWO:**[13 pts]**

- Convert each of the following BNF rules into ONE equivalent EBNF rule

- 1) $\langle \text{int} \rangle \rightarrow \langle \text{digits} \rangle \mid \langle \text{sign} \rangle \langle \text{digits} \rangle$
 $\langle \text{digits} \rangle \rightarrow \langle \text{digit} \rangle \mid \langle \text{digits} \rangle \langle \text{digit} \rangle$
 $\langle \text{sign} \rangle \rightarrow + \mid -$

$\langle \text{int} \rangle \rightarrow [(+|-)] \langle \text{digit} \rangle \{ \langle \text{digit} \rangle \}$

- 2) $\langle \text{cat} \rangle \rightarrow \langle \text{cat} \rangle "*" \langle \text{dog} \rangle \mid \langle \text{cat} \rangle "/" \langle \text{dog} \rangle$
 $\mid \langle \text{cat} \rangle \% \langle \text{dog} \rangle \mid \langle \text{dog} \rangle$

$\langle \text{cat} \rangle \rightarrow \langle \text{dog} \rangle \{ (* \mid / \mid \%) \langle \text{dog} \rangle \}$

- 3) $\langle \text{real} \rangle \rightarrow \langle \text{sign} \rangle \langle \text{int} \rangle "." \langle \text{int} \rangle "E" \langle \text{int} \rangle \mid \langle \text{sign} \rangle \langle \text{int} \rangle "." \langle \text{int} \rangle$
 $\mid \langle \text{sign} \rangle \langle \text{int} \rangle "." \langle \text{int} \rangle "E" \langle \text{sign} \rangle \langle \text{int} \rangle$
 $\langle \text{int} \rangle \rightarrow \langle \text{dig} \rangle \mid \langle \text{int} \rangle \langle \text{dig} \rangle$
 $\langle \text{sign} \rangle \rightarrow "+" \mid "-"$

$\langle \text{real} \rangle \rightarrow (+|-) \langle \text{dig} \rangle \{ \langle \text{dig} \rangle \} "." \langle \text{dig} \rangle \{ \langle \text{dig} \rangle \} ["E" [(+|-)] \langle \text{dig} \rangle \{ \langle \text{dig} \rangle \}]$

- Fill in blanks**

- 1) Rewrite rule $\langle \text{cat} \rangle \rightarrow \langle \text{cat} \rangle \dots$ given above, so that operators $*$ / $\%$ associate right to left.

$\langle \text{cat} \rangle \rightarrow \langle \text{dog} \rangle "*" \langle \text{cat} \rangle \mid \langle \text{dog} \rangle "/" \langle \text{cat} \rangle$
 $\mid \langle \text{dog} \rangle \% \langle \text{cat} \rangle \mid \langle \text{dog} \rangle$

- 2) In axiomatic semantics, each statement is preceded by a **precondition** and followed by a **postcondition**.
- 3) An attribute grammar is a context-free grammar (BNF) plus 3 additions, name any two of them:
SEMANTIC FUNCTIONS, PREDICATE FUNCTIONS, ATTRIBUTE VALUES.
- 4) Name two issues (examples) in programming languages that cannot be described by BNF rules:
- Type compatibility rules.**
 - Identifiers must be declared before referenced.**

QUESTION THREE:**[13 pts]****• Fill in blanks**

- 1) The number of tokens in a C++ statement: `while(!((dt-23*ct/17)<76)) dt=5;` is **12**
and the number lexemes of is **21**.
- 2) The weakest precondition for each kind of statements can be computed by **an axiom** or by **an inference rule**.
- 3) Ambiguities in BNF grammars of arithmetic expression can be solved by introducing **precedence rules** and **assosiativity rule** into its grammar.
- 4) In denotational semantics, the state changes are defined by **MATHEMATICAL FUNCTIONS**.
In operational semantics, the state changes are defined by **CODED ALGORITHMS**.

• Convert each of the following EBNF rule into equivalent BNF rule(s).

- 1) `<musa> → <var> { ($$ | ##) <var> }`

```
<musa>    → <var>
           | <var> $$ <musa>
           | <var> ## <musa>
```

- 2) `<SEQSTR> → <STRING> # { <STRING> # }`

```
<SEQSTR>  → <STRING> #
           | <STRING> # < SEQSTR >
```

- 3) `<comas> → <var> (+=|-|=|*=|/=|%=) [(+|-)] <int>`

```
<comas>   → <var> <op> <int>
           | <var> <op> <sign> <int>

<op>      → += | -= | *= | /= | %=
<sign>    → + | -
```

QUESTION FOUR:**[12 pts]**

Carefully study the following grammar and answer the next two questions.

$$\begin{aligned} \langle E \rangle &\rightarrow \langle E \rangle + \langle T \rangle \mid \langle E \rangle - \langle T \rangle \mid \langle T \rangle \\ \langle T \rangle &\rightarrow \langle T \rangle * \langle F \rangle \mid \langle T \rangle / \langle F \rangle \mid \langle F \rangle \\ \langle F \rangle &\rightarrow (\langle E \rangle) \mid 0 \mid 1 \mid 2 \mid 3 \mid 4 \mid 5 \mid 6 \mid 7 \mid 8 \mid 9 \end{aligned}$$

- Construct the rightmost derivation of the sentence : $2 + (3 * 7 + 6)$

$$\begin{aligned} \langle E \rangle &\Rightarrow \langle E \rangle + \langle T \rangle \\ &\Rightarrow \langle E \rangle + \langle F \rangle \\ &\Rightarrow \langle E \rangle + (\langle E \rangle) \\ &\Rightarrow \langle E \rangle + (\langle E \rangle \quad \quad \quad + \langle T \rangle) \\ &\Rightarrow \langle E \rangle + (\langle E \rangle \quad \quad \quad + \langle F \rangle) \\ &\Rightarrow \langle E \rangle + (\langle E \rangle \quad \quad \quad + 6) \\ &\Rightarrow \langle E \rangle + (\langle T \rangle \quad \quad \quad + 6) \\ &\Rightarrow \langle E \rangle + (\langle T \rangle * \langle F \rangle \quad \quad \quad + 6) \\ &\Rightarrow \langle E \rangle + (\langle T \rangle * 7 \quad \quad \quad + 6) \\ &\Rightarrow \langle E \rangle + (\langle F \rangle * 7 \quad \quad \quad + 6) \\ &\Rightarrow \langle E \rangle + (3 * 7 \quad \quad \quad + 6) \\ &\Rightarrow \langle T \rangle + (3 * 7 \quad \quad \quad + 6) \\ &\Rightarrow \langle F \rangle + (3 * 7 \quad \quad \quad + 6) \\ &\Rightarrow 2 + (3 * 7 \quad \quad \quad + 6) \end{aligned}$$

- Construct the parse tree of the sentence : $2 + (3 * 7 + 6)$

QUESTION FIVE:**[12 pts]**

- 1) A floating-point value `<float>` is a sequence of a sign (+ or -) followed by a sequence of digits followed by **dot** followed by a sequence of digits. Plus sign is optional. Examples of accepted values: +20.34567, -7.6, 307.80, -0.2, Write ONE EBNF rule to describe the `<float>` values.

```
<float> → [(+|-)] <digit> {<digit> } . <digit> {<digit> }
```

- The increment/decrement operator in C++ `<inc_dec>` is a standalone statement consisting of a variable name followed or preceded by ++ or -- such as: a++, ++a, a--, --a. The variable name `<id>` is a lower-case letter `<Let>` followed by zero or more letters or digits `<dig>`. Construct the EBNF rules for the increment/decrement operator in C++ as described above.

```
<inc_dec> → <id> ( ++ | -- ) | ( -- | ++ ) <id>
<id>      → <Let> { ( <Let> | <dig> ) }
```

- Construct BNF rules that describe the logical expression `<LE>`. A logical expression consists of one or more boolean terms `<b_term>` separated by a logical operator `||`. A boolean term consists of one or more boolean factors `<b_factor>` separated by a logical operator `&&` which has higher precedence than `||`. A boolean factor may be a variable `<var>`, relational expression `<rel_exp>`, or a logical expression enclosed between parentheses. A boolean factor may be preceded by not operator `!`. A relational expression consists of two arithmetic expressions `<AE>` separated by a relational operator `<RO>`: `==`, `!=`. All relational operators have equal precedence. Logical operators have lower precedence than relational operators. Assume arithmetic expression is already defined.

```
<LE>      → <b_term> | <LE> || <b_term>
<b_term>   → <b_factor> | <b_term> && <b_factor>
<b_factor> → <var> | <rel_exp> | ( <LE> ) | ! <LE>
<rel_exp>  → <AE> <RO> <AE>
<RO>       → == | !=
```

QUESTION SIX: Fill in blanks

[12 pts]

- 1) Give two suggestions to improve the reliability of C++:
 - **Perform index range checking.**
 - **Remove pointers.**

- 2) The two main features of imperative languages are:
 - **Algorithms of imperative languages consist of detailed ordered steps.**
 - **Imperative languages are based on variables, assignment and iteration.**

- 3) Give two suggestions to reduce the execution times of programs in any language without affecting its reliability:
 - **Reduce degree of optimization.**
 - **Use macros instead of subprograms.**

- 4) Give two disadvantages of pure interpretation systems:
 - **Pure interpretation systems are slow in execution.**
 - **Require large memory space to store source program and symbol table.**

- 5) Give two reasons why computers do not use HLL as a machine language:
 - **Designing computers that use HLL as a machine language makes computers complex and expensive.**
 - **Not flexible (Language-dependent).**

- 6) Give two advantages of using preprocessor macros:
 - **Programs with macros are generic (typeless operands).**
 - **Programs with macros execute faster than those with subprograms.**
